## Performance report for SiT9365 - 325 MHz, HCSL

### Conditions:

- Frequency 325 MHz
- VDD: 2.5 V, 3.3 V
- Room temperature
- Termination:
  - o 30  $\Omega$  series and 50  $\Omega$  to GND.

### Equipment:

| Model                                 | Measurement / Purpose   |
|---------------------------------------|---|
| Keysight DSA90604A (6 GHz, 20 Gsps)   | Period jitter, differential voltage swing, rise/fall time, duty cycle |
| Keysight 5052B Signal Source Analyzer | Phase noise, integrated phase jitter                                  |
| Keysight 34980A                       | Power supply current  |
| Keysight E3631A                       | Power supply  |
| Keysight 53230A                       | Frequency   |

### Test setup:

For waveform parameters measurement (rise/fall time, differential swing, duty cycle), both DUT outputs are terminated with 30  $\Omega$  series and 50  $\Omega$  to GND. Output signals are measured using Keysight 1134B active probe with Keysight N5425B probe head. All measurements are applied to the differential waveform. Figure 1 shows test setup diagram for waveform parameters measurement.

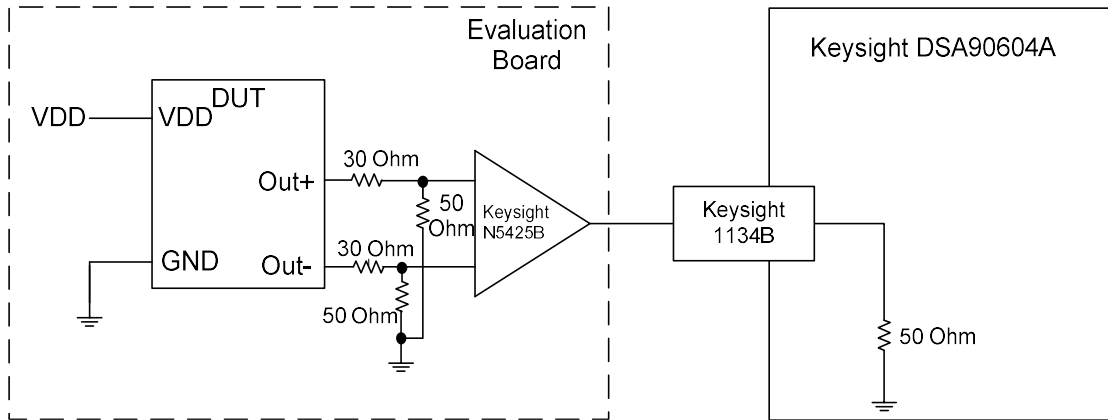

Figure 1: Test setup for measuring waveform parameters (rise/fall time, differential swing, duty cycle)

For period jitter measurement output is terminated with 30  $\Omega$  series and 50  $\Omega$  to GND at the input of hi-speed comparator (ADCMP581). AC coupled comparator's output is connected to oscilloscope channel. Figure 2 shows test setup diagram for period jitter measurement.

Figure 2: Test setup for measuring period jitter

For phase noise measurements, differential signal is converted to single-ended using impedance matching transformer. Transformer's output is connected to measurement instrument. Output is also terminated with 30  $\Omega$  series at the source side. Figure 3 shows test setup diagram for phase noise measurement.

|               | <b>Orig:</b>  |  | <b>Date:</b> | <b>April 16, 2018</b> |

Figure 3: Test setup for measuring phase noise.

For IDD measurement device output is floating. For frequency measurement differential-to-single-ended converter is used.

**Data:**

- Phase noise
- Integrated phase jitter
- RMS period jitter
- Peak-to-peak period jitter
- Rise/fall time
- Duty cycle
- Differential output swing
- IDD
- Frequency stability over temperature

Table 1: Summary performance data

| Parameter                                      | Units     | Voltage |       |
|--|-----------|---------|-------|
|  |           | 2.5 V   | 3.3 V |
| Integrated Phase jitter (1.875 MHz - 20 MHz)   | fs, rms   | 73      | 74    |
| Integrated Phase jitter (12 kHz - 20 MHz)      | fs, rms   | 213     | 214   |
| Period jitter                                  | ps, rms   | 1.00    | 0.99  |
| Period jitter (10,000 cycles)                  | ps, pk-pk | 7.68    | 7.67  |
| Duty cycle                                     | %         | 49.9    | 50.0  |
| Rise time (20% - 80%)                          | ps        | 390     | 385   |
| Fall time (80% - 20%)                          | ps        | 397     | 392   |
| Differential voltage swing                     | V         | 1.48    | 1.53  |
| Current consumption (no load, output enabled)  | mA        | 80.0    | 81.0  |
| Current consumption (no load, output disabled) | mA        | 50.1    | 50.5  |
