SiT9551

25 MHz to 644 MHz Endura™ Ruggedized Ultra-low Jitter Differential XO

SiTime

Description

The SiT9551 is a ruggedized ultra-low jitter differential ApexMEMS™ oscillator engineered for military and aerospace applications. It delivers the most stable timing under environmental stressors such as shock, vibration, high heat, rapid thermal transients, and power supply noise.

In addition to standard differential signal types, a unique FlexSwing™ output-driver performs like LVPECL and provides independent control of voltage swing and DC offset to simplify interfacing with chipsets having non-standard input voltage requirements and eliminate all external source-bias resistors. The device also integrates multiple on-chip regulators to filter power supply noise, eliminating the need for an external dedicated LDO.

The SiT9551 is factory programmed for specific combinations of frequency, stability, output signaling, voltage, and output enable functionality. Programmability enables designers to optimize clock configurations while eliminating long lead times and customization costs associated with quartz devices where each combination is custom built.

The wide frequency range and programmability makes this device ideal for communications, enterprise, and military and aerospace applications that require a variety of frequencies and operate in noisy environments.

Refer to Manufacturing Notes for proper reflow profile, tape and reel dimension, and other manufacturing related information.
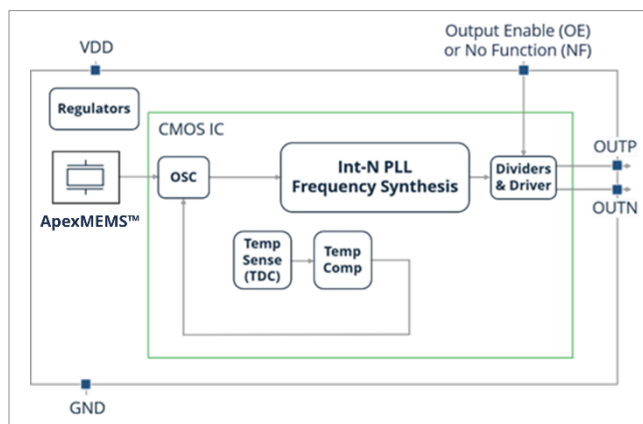

Features

- 0.04 or 0.1 ppb/g acceleration sensitivity for harsh environments
- Select frequencies from 25 MHz to 644.53125 MHz. See Ordering Information
- 70 fs RMS typical phase jitter, 12 kHz to 20 MHz
- 50 fs RMS typical phase jitter for SerDes applications
- 9 fs/mV typical PSNR
- LVPECL, LVDS, HCSL, Low-power HCSL, and FlexSwing signaling options
- ± 20, ±30 and ±50 ppm frequency stabilities
- Wide temperature range (-55°C to 125°C)
- Factory programmable options for low lead time
- 1.8 V, 2.5 V, 3.3 V, and wide continuous power supply voltage range options
- 2 x 1.6, 2.5 x 2, 3.2 x 2.5 mm x mm package

Applications

- Airborne Communications
- Command and Control
- Field Communications
- Airframe/Engine Management Control
- Radar
- SATCOM

SiT9551 features 45 fs RMS phase jitter for SerDes applications. Figure 4 shows the phase noise (green curve) observed by the system, after accounting for aliased phase noise when filtering (gray curve) the measured SiT9551 phase noise (blue curve). This "4-16A" phase jitter analysis methodology more accurately estimates reference clock jitter than the legacy "12 kHz to 20 MHz" brick-wall filter methodology. It can be applied to all modern SerDes applications to optimize system performance. See "4-16A" Phase Jitter Methodology for SerDes Applications for more information.

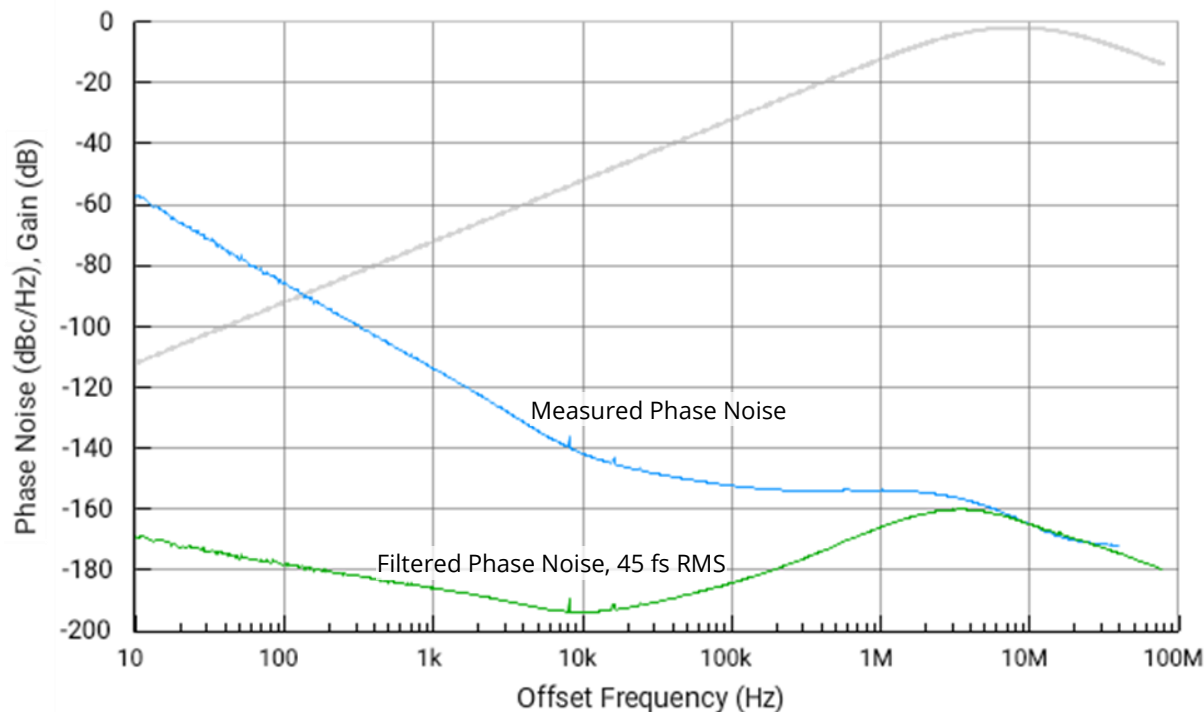

Figure 4. Phase noise before and after filtering for SiT9551 (156.25 MHz, LVPECL, 2.5V, 25°C). The filter is applied to analyze phase noise with aliasing included up to the 3rd harmonic and features first-order filter cutoff frequencies of 4 MHz (high pass) and 16 MHz (low pass).

Output Enable Time 1	T_oe	–	–	100+3 clock cycles	ns	For all signaling types except Low-Power HCSL. Measured from the time OE pin toggles to enable logic level to the time clock pins reach 90% of final swing. See Figure 26 for waveform.
Output Enable Time 2	T_oe	–	–	500+3 clock cycles	ns	For Low-Power HCSL signaling type. Measured from the time OE pin toggles to enable logic level to the time clock pins reach 90% of final swing. See Figure 26 for waveform.
Output Disable Time	T_od	–	–	100+3 clock cycles	ns	Measured from the time OE pin toggles to disable logic level to the last clock edge. See Figure 27 for waveform.

Table 3. Electrical Characteristics – Common to All Output Signaling Types (continued)

Parameter	Symbol	Min.	Typ.	Max.	Unit	Condition
Jitter and Phase Noise, measured at f = 156.25 MHz						
4-16A Phase Jitter[1]	T_416A	–	50	64[2]	fs RMS	Measured with phase noise analyzer, extending (flat) phase noise to 3rd harmonic (i.e., 312.5 MHz offset), folding phase noise below the Nyquist frequency (i.e., 78.125 MHz offset), filtering and integrating from 10 kHz to Nyquist. Uses 4 MHz high pass and 16 MHz low pass filters, each with 20 dB/dec roll off. Includes spurs. See "4-16A" Phase Jitter Methodology for SerDes Applications for additional details.
0.012-20 Phase Jitter (legacy)[1]	T_phj	–	70	100	fs	Measured with phase noise analyzer, integrating between 12 kHz and 20 MHz offset frequency. Recommended for SONET OC-48 applications. Contact SiTime for 85 fsec Max phase jitter option.
Spurious Phase Noise	T_spn	–	–	-101	dBc	12 kHz to 20 MHz offset frequency range
RMS Period Jitter[3]	T_jitt_per	–	0.5	0.72	ps	Measured based on 10K cycle
Peak Cycle-to-cycle Jitter[3]	T_jitt_cc	–	3.5	4.4	ps	Measured based on 1K cycle

Note:
1. Recommended for SerDes applications to improve the accuracy of clock jitter analysis, replacing the traditional 12 kHz to 20 MHz brick wall filter when application-specific filter characteristics are not explicitly specified.
2. Max phase jitter for LVPECL.
3. Measured according to JESD65B using Keysight DSAX91604A Oscilloscope.

Table 4. Electrical Characteristics – LVPECL | Supply voltage ("order code"): 2.5 V ±10% ("25"), 3.3 V ±10% ("33"), All typical specifications are measured at nominal supply voltage of 2.5 V and nominal frequency of 156.25 MHz unless otherwise stated. See Figure 9 and Figure 10 for test setups.

Notes:
4. θ_{JA}, Ψ_{JT}, θ_{JB} and θ_{JC} are provided according to JEDEC standards 51-2A, 51-7, 51-8, and 51-12.01 with a 25C ambient and 250 mW power consumption (typical of 1 GHz f_{out}). The conduction thermal resistances θ_{JB} and θ_{JC} are obtained with the assumption that all heat flows from the junction to a heat sink through either the solder pads (θ_{JB}) or the top of the package ($\theta_{JC,Top}$). These may be used in a two-resistor compact model. The values of θ_{JA} and Ψ_{JT} are strongly application dependent, and we report values based on the JEDEC thermal environment. θ_{JA} is the thermal resistance to ambient on a JEDEC PCB - it is a highly conservative estimate, since the JEDEC board does not have vias to PCB planes in the vicinity of the package. Ψ_{JT} can be used to estimate the junction temperature from measurements of the temperature at the top of the package if the thermal environment is similar to the JEDEC environment.

Notes:
7. OE pin includes a 120 kΩ internal pull-up resistor to VDD when active high, and a 120 kΩ internal pull-down resistor to GND when active low. In noisy environments, the OE pin is recommended to include an external 10 kΩ resistor (Use 10kΩ pull-up if active high OE; use 10kΩ pull-down if active low OE) when the pin is not externally driven.
8. Differential Logic high means OUTP=VOH, OUTN=VOL
9. Can be left open. SiTime recommends grounding it for better thermal performance.
10. A capacitor of value 0.1 µF or higher between VDD and GND pins is required.

"4-16A" Phase Jitter Methodology for SerDes Applications

Proper evaluation of reference clock (refclk) jitter is critical to optimize system performance in high-speed serial links.

Figure 6 shows how the traditional 12 kHz to 20 MHz analysis of filtering refclk jitter can mislead designers to select components that degrade rather than improve link performance. Using a more accurate filter analysis predicts a 50% reduction (45 vs 94 fs RMS) in jitter. Therefore, this datasheet replaces the legacy 12 kHz to 20 MHz filter analysis with a more accurate and established methodology adopted by several industry standards (e.g. PCI Express, CXL, UCIe) and implemented here as "4-16A" phase jitter. A brief overview follows.
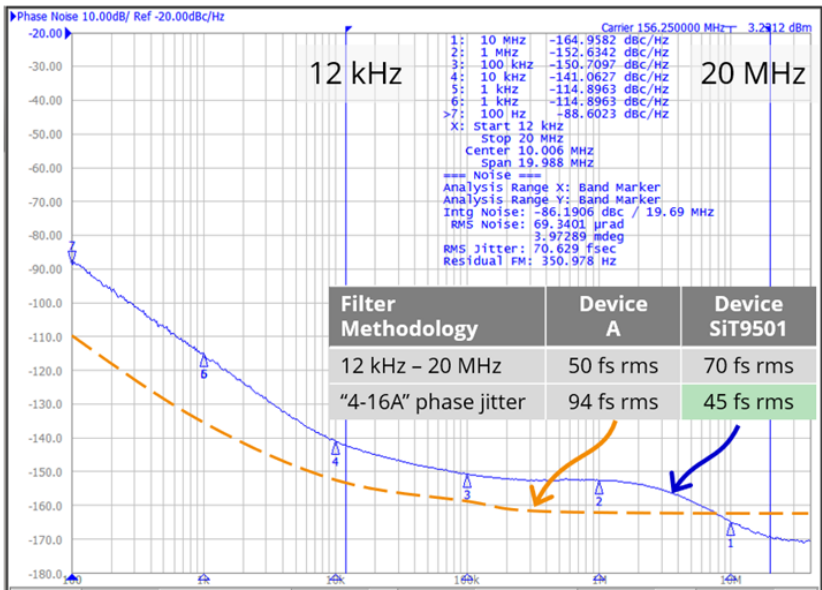

Figure 6. Two products analyzed with 2 different methodologies lead to opposite conclusions. The "4-16A" phase jitter methodology more accurately predicts in-system performance for modern SerDes applications.

Established in 1991 for SONET OC-48 line rates, the traditional 12 kHz to 20 MHz jitter filter served as a golden reference to evaluate refclk jitter for over 30 years. The filter is used is nearly all clock and timing datasheets today. However, the results it provides no longer correlate with system performance and can create suboptimum link performance. Sources of filter error include incorrect corner frequencies, unrealistic brick-wall roll offs and a lack of accounting for aliased phase noise. Errors of tens of femtoseconds are significant today and will become more significant as data rates increase. For these reasons, we recommend customers adopt the more accurate "4-16A" phase jitter methodology for SerDes applications.

The conventional refclk jitter analysis uses a band-pass filter, as shown in Figure 7, to extract the refclk contribution to jitter observed at the receiver. Historically the refclk jitter filter was arbitrarily applied to phase noise up to an offset equal to the refclk Nyquist frequency. However, this ignores higher-offset phase noise that aliases when the refclk is sampled by a PLL's digital phase detector. Studies have shown that extending the measured phase noise data flat to the third harmonic (or, twice the fundamental frequency in the offset-frequency axis) accurately estimates worst-case phase jitter[11]. Above the third harmonic, phase noise rolls off quickly and can be ignored.

Note:

11. "How to evaluate reference-clock phase noise in high-speed serial links", Signal Integrity Journal (May 3, 2019).
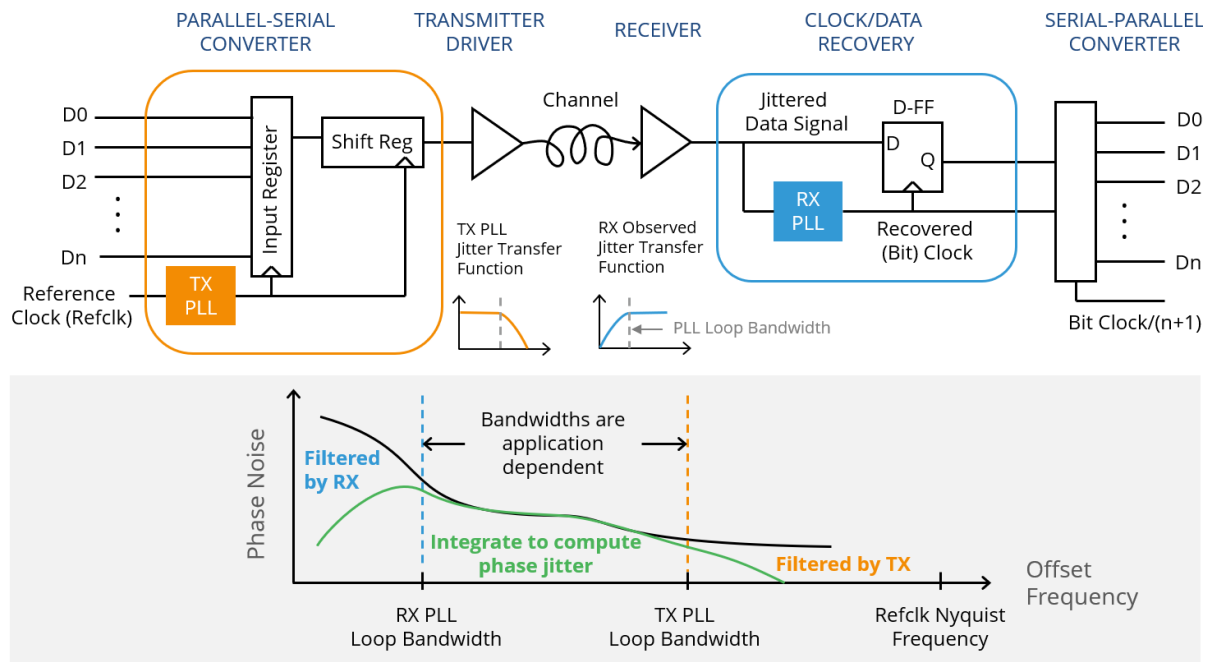

Figure 7. A generic serial link (top) uses a transmit PLL and receive CDR to low and high pass filter, respectively, refclk phase noise. This forms a band-pass system filter (bottom) for computing phase jitter.

The left Figure 8 chart illustrates this methodology of filtering aliased phase noise for a 156.25 MHz clock. Direct phase noise analyzer instruments (e.g., E5052B or FSWP) include an anti-aliasing filter. Thus, to account for aliasing, the phase noise is extended flat to the 3rd harmonic (468.75 MHz in the signal spectrum, or 312.5 MHz in offset frequency spectrum) and the jitter filter is folded across

Nyquist-zone boundaries (at 156.25/2, 156.25 and 156.25×3/2 MHz). Then the phase noise data is filtered and integrated to derive phase jitter. The right chart in Figure 8 illustrates a mathematically equivalent process that aliases the extended phase noise below an offset equal to the Nyquist frequency before filtering in the first Nyquist zone[11].
Figure 8. Illustration of two equivalent processes to filter aliased phase noise. The left chart extends (black) the measured phase noise (orange) to the 3rd harmonic, mirrors the filter (blue) across higher Nyquist zones before deriving the filtered phase noise (green). Alternatively, the right chart aliases the extended phase noise (not shown) below the Nyquist frequency before filtering (green). Integrating either green curve produces the same phase jitter.

A shorthand label for this methodology is "#-#A" phase jitter where the first and second numbers "#" are replaced with RX CDR and TX PLL bandwidths, respectively, and assuming 20 dB/dec roll offs (unless specified otherwise), and "A" indicates that aliasing is included. For example, "4-16A" phase jitter uses 4 MHz RX and 16 MHz TX bandwidths with aliasing. Here, 4 MHz represents the most common serial standard, Ethernet, which typically specifies a CDR bandwidth of 4 MHz for 10 Gbps and higher link

rates, and 16 MHz represents a worst-case estimate for TX PLL bandwidth (the PLL becomes unstable at higher bandwidths). This shorthand terminology makes it easy to describe variations. For example, "2-10A" phase jitter describes the same methodology but for 2 MHz RX CDR and 10 MHz TX PLL bandwidths. In practice, the exact bandwidths are application dependent, and "4-16A" is simply chosen here to represent the most common application (Ethernet).

FlexSwing Configurations

A FlexSwing output-driver performs like LVPECL and additionally provides independent control of voltage swing and DC offset voltage levels. This simplifies interfacing with chipsets having non-standard input voltage requirements and can eliminate all external source-bias resistors. FlexSwing supports power supply voltages from 1.71 V to 3.63 V, and the programmable VOH and VOL levels may be referenced to the voltage on either VDD or GND pins.

The above table identifies supported combinations of nominal VOH (i.e. VHn) and nominal VOL (i.e. VLn) in colored boxes. The two-character code in each box corresponds to the VHn and VLn codes specified in the 2nd column and 2nd row in the table, respectively. The number in each box indicates the nominal differential swing (i.e. VHn – VLn).

For example, order code "FS" selects VHn code "F" (i.e. Vdd-1.144 V) and VLn code "S" (i.e. Vdd-1.530 V) corresponding to a V_Swing of 0.845 V peak-peak, which may be used for supply voltages of 2.5 V ±10%, 3.3 V ±10% or (2.25 V to 3.63 V). Alternatively, an order code of "GS" corresponds to a VHn code "G" (i.e. Vdd-1.193 V) and a VLn order code "S" (e.g. Vdd-1.530 V) corresponding to a V_Swing of 0.760 V peak-peak, which may be used for a supply voltage of 3.3 V ±10%.

Test Circuit Diagrams

A 1.5 pF capacitive load is used at each differential output. Because of the additive input capacitance of the active probe used with the oscilloscope, the output characteristics for all signal types are measured with a total of 2 pF capacitive load.

Termination Diagrams

LVPECL and FlexSwing Termination

The SiT9551 FlexSwing output drivers support low power without sacrificing signal integrity via simple terminations as shown in Figure 29 and Figure 31,compared to traditional LVPECL drivers. The FlexSwing and LVPECL outputs are voltage-mode drivers. Use the table and figures below to select a termination circuit for the desired supply voltage. The table also provides LVPECL current consumption (I_load) into the load termination.

21. Top Marking: Y denotes manufacturing origin and XXXX denotes manufacturing lot number. The value of "Y" will depend on the assembly location of the device.
22. A capacitor of value 0.1 µF or higher between VDD and GND is required. An additional 10 µF capacitor between VDD and GND is required for the best phase jitter performance.
